                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cc potentially useful for treatment of cancer, where the inhibitor is active con a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (IOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic cancers, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove alignant cells from bone marrow transplants. AAZ55812-226825 represent

                                                                                                                                                                                                               interferon regulatory factor 1; (d) complement-binding protein; glycoproteins B, M or L; (d) capsid protein IV encoded by ORF65; and (e) immediate early protein encoded by ORF73. Labelled probes for the nucleic acid, proteins encoded by it, and antibodies (Ab) specific for the proteins are useful for detecting HHV8; specifically for diagnosis of Kaposi's sarcoma, in body fluids or tissue samples. HHV8 infections can be treated with antisense or triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHV8 infection, while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and
                                                                    HHV8 may be implicated in many other lymphoproliferative diseases such as lymphomas, leukaemia, splenomegaly and mycosis fungoides. Cells and animals containing the nucleic acid are useful for drug screening. HHV8-derived peptides can be used as targets for antiviral drugs, e.g. dihydrofolate reductase gene can be inhibited with methotrexate. These can also be used to determine the immune status of a patient infected with HIV. HHV8 derived protein viral MIP III may be used as an anti-
                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is a primer for DNA encoding the Kaposi's sarcomassociated herpes virus (KSHV) macrophage inflammatory protein II (MIP associated herpes virus as a buman herpes virus 8 (HHV8). The amplified I). KSHV is also known as buman herpes virus 8 (HHV8). The amplified sequence is an example of the DNA of the invention which encodes a KSHN polypeptide selected from: (a) viral MIP II; (b) viral II-6; (c) viral polypeptide selected from: (a) viral MIP II; (b) viral II-6; (c) viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid encoding Kaposi's sarcoma associated herpes virus proteins - useful for, e.g. detecting levels of HHV8 in, and preparation of vaccines for treatment of, HIV patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           05-SEP-1996

                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                      This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and can alignant cells from bone marrow transplants. AAZ25812-Z26825 represent when polymorphic sites described in the method of the invention

```
This invention describes a novel method for identifying an inhibitor CC potentially useful for treatment of cancer, where the inhibitor is active CC on a gene vital for cell growth or viability, and where the gene is CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient having a CC precancerous condition, by administering to the patient a first allele Specific inhibitor (ASI) targeted to an allele of a first essential gene CC present in cells of the precancerous condition, where the normal sematic CC cells of the patient are heterozygous for the first gene, the inhibitor CC is active on at least one but less than all allelic forms of the gene CC present in a population and targets only one allelic form present in the cormal sematic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic CC lesions, benign tumours, endometriosis, polycystic kidney disease, and CC graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent xx

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial chyperroholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, Bhlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obseity), strength, speed, cendurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                The present sequence represents a fragment of the multiple sclerosis (MS) associated retrovirus-1 (MSRV-1) DNA sequence. This sequence was used as a template to design a complementary 3' primer. The 3' primer was used during the synthesis of MSRV-1 CDNA which encoded a region of the MSRV-1 genome starting from the pol gene sequence and extending towards the gag gene. The invention provides complete or partial genomic sequences of the
MSRV-1 pol gene, gag gene and env gene, and polypeptides encoded by these genes. The invention also provides antibodies raised against the polypeptides. The genomic sequences, polypeptides and antibodies are also
                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;
                                                                                                                                                                                                                                                                                                                                                                      New nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26-NOV-1997;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Multiple sclerosis associated retrovirus.

                                                                Sequence 21 BP; 5 A; 7 C; 8 G; 1 T; 0 U; 0 Other;
                                                                                            AAV62907-V62927 are PCR primers used in the amplification of a human galactokinase. This protein is used in a method to detect galactokinase mutations. This protein and its encoding nucleic be used in methods allowing the detection, diagnosis and treatments.
                                                                                                                                                                      Detection of galactokinase mutations - gene sequence or altered galactokinase
                                                                                                                                                                                                                                                                                                                                                                                         Galactokinase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is a reverse PCR primer designed for use with a forward primer (see AAV52638) in the PCR amplification of exon 4 and the flanking introns of the human hepatocyte nuclear factor-1 alpha (HNF-1 alpha) gene (see AAV52625). Mutations of the HNF-1 alpha gene have been identified by amplifying (see AAV52632-51) and sequencing the appropriate exon. The invention concerns the identification of genes responsible for non-insulin dependent diabetes mellitus (NNDDM) for use in diagnostics and therapeutics. It demonstrates that the MODY3 (maturity-onset diabetes of the young) locus is the HNF-1 alpha gene, Analysis of mutations in the
                                                                               New dendritic cell receptor belonging to TNF receptor family treat e.g. cancer, AIDS, bacterial and viral infections, insu

free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human IL4 receptor. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway disease characterised by an inflammatory response. By elimination administrative fibrosis and other airway diseases characterised by an

                    CC used in the construction of a plasmid pIK.F7 is CC used in the construction of a retroviral packaging plasmid used for the production of high titres of recombinant retrovirus in human cells. The CC retroviral packaging plasmid comprises a retroviral helper DNA sequence CC derived from a replication-incompetent retroviral genome that encodes, in CC trans, all virion proteins required for packaging such a retroviral CC leukaemia virus (MMLV) or gibbon ape leukaemia virus (GALV) gag and pol; CC and a xenotropic, amphotropic, ecotropic or polytropic envelope protein. CC The packaging plasmids, designated KAT plasmids, are used with a second cretroviral vector encoding a foreign gene of interest to produce commamalian cells with retroviral supernatants that express, e.g. a cC hormone, lymphokine, growth factor or coagulation factor. The plasmids cretrovirus particles; gag, gol and env. The stable producer continue to produce high titre retrovirus indefinitely in the absence of continue to produce high titre retrovirus indefinitely in the absence of continue to produce high titre retrovirus indefinitely in the absence of continue to produce high titre retrovirus indefinitely in the absence of continue to the stable integration of both packaging function cand virus vector. The retroviral vector plasmids are constructed with express enable continued to the episomal persistence without the need for stable continued to the vector plasmids are constructed with sequences enabling the episomal persistence without the need for stable continued to the vector plasmids are constructed with sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Local Similarity Matches 17; Conserv

The retroviral packaging plasmids are used to transfect a cell which also comprises at least one retroviral helper DNA sequence derived from a replication incompetent retroviral genome. The helper sequence encodes in trans, all virion proteins required for packaging a replication-incompetent retroviral vector and for producing virion proteins which package the replication-incompetent retroviral vector. The retroviral NA sequence does not encode the native enhancer and/or promoter of the viral 5' long terminal repeat (ITR), and lacks both the psi function sequence responsible for the packaging helper genome and the 3'LTR. The method can be used to transduce primary human realls in 10 ludge.
This primer is used for the PCR amplification of the vMIP-II region of the Kaposi sarcoma-associated herpes virus (KSHV or HHV8) genome sequence. The KSHV genome has a long unique region (LUR) flanked by a
                                                                                                                                                                                                                                                                                                                                                                                29-JAN-1996;

밁 8

This sequence represents a poly-CTT oligonucleotide used in a method of purifying double-stranded DNA to pharmaceutical purity, especially for use in gene or cellular therapy. The method comprises at least one stage of chromatography on a column of ceramic hydroxyapatite (HA), and anothes stage comprising an affinity chromatography purification, preferably with an immobilised oligonucleotide able to form a triple-helix structure.

HA), and another preferably with

Purification of double-stranded DNA to pharmaceutical ceramic hydroxy:apatite and affinity or ion-exchange particularly for plasmids intended for gene therapy.

l purity - using chromatography,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC number of terminal repeat (TR) units. The LUR includes many conserved CC dependent HIV-1 replication. The viral MIP (vMIP) like proteins have CC conserved C-C dimer signatures characteristic of beta-chemokines and a conserved C-C dimer signatures characteristic of beta-chemokines and a conserved C-C dimer signatures characteristic of beta-chemokines and a conserved C-C dimer signatures characteristic of beta-chemokines and a conserved C-C dimer signatures characteristic of beta-chemokines and a conserved C-C charbodies and antigens encoded by the KSHV nucleic acid and labelled CC KSHV nucleic acid are useful in standard hybridisation and immune assays for diagnosis of Kaposi sarcoma or for monitoring treatment. Antisense concludes and triplex forming oligonuclectides that hybridise to the KSHV nucleic acid, and antiviral agents that bind specifically to a KSHV polypeptide are used to treat Kaposi sarcoma. The antibodies can be used for treatment or prevention of the disease. The KSHV polypeptide is useful in subunit vaccines and also to inhibit replication of human consumer of other lymphoproliferative diseases such as lymphomas, lymphatic number of other lymphoproliferative diseases such as lymphomas, lymphatic as an anti-inflammatory agent for treating autoimmune disease, especially consumerated arthritis. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

The present sequence is a preferred example of a suitable oligonucleotide which forms a triplehelix with a polyGAA sequence in dsDNA. The polyGAA sequence may be present naturally, e.g. in a plasmid origin of replication, or can be introduced artificially. The method is particularly suited to

Example; Page 18; 90pp; English

The sequence is that of the DRB3 3' downstream intron which was design of allele and group specific primers for use in a method for determining HLA-DR beta sub-type in a nucleic acid sample. The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozygous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and can be utilised in tissue typing, determination of individual identity and identifying disease susceptible individuals. See also AAQ256092-Q26387. (Updated on 25 -MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human mAB light chain VI region; PCR primer; pIK. Freceptor associated signal transduction pathways; lymphocytes; haematopoietic stem cells; ss.
                       AAQ74334 and AAQ74335 are a pair of primers for the PCR amplification of the human mab light chain VI region, which was used in the construction of the plasmid pIK.K/L-int. The plasmid was constructed to direct the expression of a chimeric fusion protein for receptor associated signal transduction pathways. The chimeric DNA sequences could be used to modify lymphocytes and haematopoletic stem cells as precursors to a number of important cell types. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                       New chimeric DNA encoding chimeric signal transduction pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human mAb

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ö,
                                                                                                          This primer is used in production of a retrovirus vector and packaging complasmid system. The primer is used, along with primer AAO/36241, to amplify an HIV gp41 human monoclonal antibody IgG1 98.6 variable region complainty and HIV gp41 human monoclonal antibody IgG1 98.6 variable region light chain gene from plasmid pIK.98.6-kappa-FL, by polymerase chain creaction. A Sall site is placed at the 3'-end of the sequence, followed by ligation along with linkers AAO/36243-44 between EcoRI and EgIII sites of plasmid pIK1.1, to give plasmid pIK.K/L-int. The resulting clone is used with heavy chain sequences to produce a single chain antibody and CD crecombinant vector may be used along with new retrovirus packaging plasmids in a system for high-efficiency transduction of mammalian target cells with foreign genes (e.g. for gene therapy) by transient cotransfection of a packaging cell culture by a replication-incompetent helper plasmid and a recombinant vector, to produce high-titer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a novel isolated polynucleotide (I) comprising a CC sequence which is a polynorphic variant (PY) of a reference sequence for CC colony stimulating factor 1 receptor (CSFIR) gene, found on The CC polypeptide are useful for improving the discovery and development of CC malignant histiccytosis, myeloid malignancies, and inflammatory disorders CC malignant histiccytosis, myeloid malignancies, and inflammatory disorders CC and the haplotypes can be used to validate CSFIR activity, e.g., and the haplotypes can be used to validate CSFIR as a candidate target for treating a specific condition or disease predicted to be associated CC with CSFIR activity. Genotyping the CSFIR gene of an individual can also be used in developing diagnostic tests and therapeutic treatments. (I) is CC useful in studying the expression and function of CSFIR, and in CC expressing CSFIR protein for use in screening for candidate drugs to the variation on the biological activity and in studying the effect of the variation on the biological activity of CSFIR as well as on the CC binding affinity of candidate drugs targeting CSFIR. Antibodies are useful in a variety of diagnostic and prognostic formats and therapeutic CC effect agents and compounds. Allele specific oligonucleotides (ASO) are useful as probes and compounds. Allele specific oligonucleotides (ASO) are useful as probes and primers, and for testing the efficacy of the phenotypic effect of any particular CSFIR or haplotype the invention provides a constitute of any particular CSFIR or haplotype the invention provides a constitute of the phenotypic effect of any particular cSFIR or haplotype the invention provides a constitute of the method of the invention cSFIR gene polymorphisms, and constitute of the invention cSFIR gene polymorphisms, cC described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

ADP88372
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The invention also relates to antibodies specific to the NOVX polypeptides. The polypeptides, polynucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as a pathology associated with the NOVX polypeptide. The sequences are useful for diagnosing, treating or preventing a NOVX-associated disorder, e.g., cancer, atherosclerosis, diabetes, Alzheimer's disease, Parkinson's disease, graft-versus-host disease, scleroderma, hypertension, haemophilia, idiopathic thrombocytopenic purpura, immunodeficiencies, AlDS, dyslipidemia, cachexia, multiple sclerosis or fertility. The nucleic acids may be used as hybridisation probes, in chromosome mapping, in tissue typing, in pareventive medicine or in pharmacogenomics. This sequence represents a preventive medicine or in pharmacogenomics. This sequence represents a proventive medicine or in pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cc winow polypeptides. The polypeptides, polynucleotides and antibodies are useful for manufacturing a medicament foor treating a syndrome associated with a human disease, such as a pathology associated with the NOVX polypeptide. The sequences are useful for diagnosing, treating or comprehensing a NOVX-associated disorder, e.g., cancer, atherosclerosis, and in the control of the sequences are useful for diagnosing, treating or comprehensing a NOVX-associated disorder, e.g., cancer, atherosclerosis, and is sease, scleroderma, hypertension, haemophilia, idiopathic conservation, control of thrombocytopenic purpura, immunodeficiencies, AIDS, dyslipidemia, cobesity, Crohn's disease, bronchial asthma, anorexia, cancer-associated cachexia, multiple sclerosis or fertility. The nucleic acids may be used as hybridisation probes, in chromosome mapping, in tissue typing, in preventive medicine or in pharmacogenomics. This sequence represents a CC preventive medicine or in pharmacogenomics. This sequence represents a CC primer used in analysis of expression of a human NoVX polynucleotide of the invention.

The invention relates to an isolated polypeptide (designated NOVX, or NOVI-NOVI27) comprising a sequence selected from 178 fully defined amino CC acid sequences (and their mature forms, variants and fragments). Also cid comprising the nucleic acid, a cell comprising the vector, methods for determining the presence or amount of the polypeptide or the nucleic acid molecule encoding NOVX, a vector comprising the nucleic acid, a cell comprising the vector, methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian cut in the treatment of a pathology an agent that binds to the above polypeptide, a method for identifying an agent that binds to the above polypeptide, a method for identifying a potential therapeutic agent for cuse in the treatment of a pathology that is related to aberrant cut se in the treatment of a pathology that is related to aberrant cut se in the treatment of a pathology that is related to aberrant cut sering for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide and a method for modulating the pathology associated with the polypeptide and a method for modulating the activity of the polypeptide cited above. The composition and methods care useful for diagnosing, preventing or treating diseases such as concertance, observe, immune disorders, haematopoietic disorders, diseases in munications of the polypeptide are also useful as vaccines. The corposent sequence is an RTQ-PCR (real time quantitative PCR) primer used cut of assay tissue specific expression of a NOVX mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Padigaru M, Sı

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of diagnosing non-small cell lung cancer (NSCLC) or a predisposition to developing NSCLC in a subject by determining the expression level of a NSCLC-associated gene in a biological sample derived from the subject, where an increase or decrease of the level compared to a normal control level of the gene indicates that the subject suffers from or is at risk of developing NSCLC. The method is useful in diagnosing NSCLC or a predisposition to developing NSCLC in a subject. The compound, polynucleotide and the encoded polypeptide and composition are useful in treating or preventing NSCLC. This sequence corresponds to a primer for semi-quantitative PCR amplification of genes that are differentially expressed in NSCLC cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              30-SEP-2002;

It was used, with the primer given in ABV74196, to examine the expression profile of 19.5-like mRNA in human tissues. Expression was detected in gastrointestinal tissues including the colon, small intestine and stomach, with lower signals in the trachea, salivary gland and parotid. The invention provides 19.5 and 19.5-like nucleic acids, polypeptides antibodies useful for the diagnosis, amelioration and/or treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid molecule encoding a 19.5 or 19.5-like polypeptide, useful for diagnosing, treating or ameliorating the of psoriasis, and in genetically or physically mapping the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      19.5-like polypeptide; psoriasis; gene therapy; antipsoriatic;
PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  27-JAN-2003

                                    atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphopoliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                          associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene. VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host diseases, hypersenstivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

                                                                           The invention relates to a novel method of mutation analysis of a target nucleic acid which comprises incubating a sample having the target nucleic acid in a reaction mixture, in the presence of at least one first and second nucleic acid, where incubation produces amplified products, generating duplexes in the amplified products and detecting the presence or absence of a heteroduplex from the duplexes, where its presence indicates a potential mutation in the target nucleic acid. The method and compositions of the invention may be useful for analysing mutation and diagnosing pattents affected with PKD (polycystic kidney disease). The current sequence is that of a PCR primer of the invention which was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       is useful for studying comparative human genomics of the genes related acclimitisation to low oxygen at high altitudes and deep oceanic explorations. Rod gene probe is useful for studying comparative human genomics of the gene related to acclimitisation to low light like night blindness. The method efficiently identifies myctophid larva and facilitates the assessment of water bodies, estimation of genetic resources and genetic variability between myctophid population. The present sequence is a species specific PCR primer for a myctophid fish
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analyzing mutations of a target from generated duplexes, useful polycystic kidney disease.
                                                                                                                                                                                                                                                                                                                                                                                                               Claim 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2003-897708/82
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 12-OCT-2001; 2001US-0328739P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      26-FEB-2002; 2002US-00083246
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           14-AUG-2003.

                                                                                                                                                                              inhibit an anglogenic response, involving contacting an inactive pro for convertase-activated form of an integrin alpha subunit, metalloprotease MTI-MMP and a candidate agent, under conditions which promote increased activation of the integrin subunit and correlating inhibition of increased activation with ability of the agent to inhibit angiogenesis. The method is used to screen for agents which inhibit an angiogenic response, and the agents are used in the treatment of associated diseases including cancer, macular degeneration, arthritis are retinopathies. The present sequence is a PCR primer used in the exemplification of the invention to identify angiogenesis inhibitors

                                                                                                                                  CC the internally transcribed spacer region 2), PSL PROL (from the mitochondrial D-loop region), and ROD PSL SLWB (from the Rhodopsin gene). CC The gene regions for probe preparation are mitochondrial gene chosen from CC cytochrome b (Cytb), and mitochondrial control region (D-loop), 12S RNA CC and 16S RNA genes, or nuclear gene chosen from rhodopsin (Rod) and CC internal transcribed spacer (ITS-2) gene. The method is useful for CC developing nucleotide probes for myctophid fishes such as Stenobrachius CC leucopsarus, Protomyctophum crockeri, Tarletonbaenia crenularis, CC Lampanyctus regalis, or Diaphus theta. The DNA probes are useful for CC chromosomal mapping of the myctophid species. The lantern fish primer Sets and specific probes are useful in kit form. The species specific primers are useful to amplify a selected gene region to produce DNA CC probe, which are directed as genetic markers. Cyt b probe of myctophids is useful for studying comparative human genomics of the genes related to acclimitisation to low oxygen at high altitudes and deep oceanic caplorations. Rod gene probe is useful for studying comparative human genomics of the gene related to acclimitates. The method efficiently identifies myctophid larva and comparative human genomics of the gene related to acclimitates. The method efficiently between myctophid larva and comparation of genetic variability between myctophid population. The process as species specific PCR primer for a myctophid fish
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to developing nucleotide probes for myctophid fishes by extracting fish NNA, amplifying NNA by selected primers, reamplifying DNA, purifying after cycle sequencing of eluted DNA, confirming sequence of target DNA, ligating DNA in vector, introducing vector into host, checking purity and specificity of cloned DNA probe, amplifying gene insert from probe, and designing species specific primers from the probe. Also included is the nucleotide base sequences of the amplified probes PSL CTYL (from the cytochrome B gene), PSL ITS2F (form the internally transcribed spacer region 2), PSL PSL PSL TROME TO THE PSL TR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Developing nucleotide probes for myctophid fishes by extracting fish DNA, amplifying DNA, preparing chimeric vector, introducing into host, confirming cloned probe DNA, and designing species specific primers from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Goswami U,

ID ADH6036
The invention relates to developing nucleotide probes for myctophid CC fishes by extracting fish DNA, amplifying DNA by selected primers, CC reamplifying DNA, purifying after cycle sequencing of eluted DNA, CC confirming sequence of target DNA, ligating DNA in vector, introducing CC vector into host, checking purity and specificity of cloned DNA probe, CC amplifying gene insert from probe, and designing species specific primers CC from the probe. Also included is the nucleotide base sequences of the CC mitochondrial D-loop region), and ROD PSL SIMB (from the Rhodopsin gene). The internally transcribed spacer region 2), PSL PROL (from the Rhodopsin gene). The gene regions for probe preparation are mitochondrial gene chosen from CC cytochrome b (Cytb), and mitochondrial control region (D-loop), 12S RNA CC and 16S RNA genes, or nuclear gene chosen from rhodopsin (Rod) and CC internal transcribed spacer (ITS-2) gene. The method is useful for CC developing nucleotide probes for myctophid fishes such as Scenobrachius CC lampanyctus regalis , or Diaphus theta. The DNA probes are useful for CC chromosomal mapping of the myctophid species. The lantern fish primer CC sets and specific probes are useful in kit form. The species specific CC primers are useful to amplify a selected gene region to produce DNA probe of myctophids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                           The invention relates to a novel method for gene expression analysis by collective quantitative analysis of the expression of a number of genes to identify those that are promoted or inhibited in a given cell or tissue. The genes are preferably gene families such as the G protein coupled receptor family, tyrosine oxidase receptor family, or ion channe gene family. The methods may be used in treatment of cancers, including prostate, ovarian, stomach, bladder, breast, and cancer of the intestines. EDG-1 and EDG-2 receptor agonists and antagonists may be used in the treatment and prevention of atherosclerosis, myocardial infarction, infarct or ischaemic disease of the brain. This polynucleotide sequence represents a PCR primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gene expression

                           S
                                                                                                                                                     This invention describes a novel method of preparing a library of protein CC croducing eukaryotic cells comprising (a) introducing specific cc recombination signals into one or two chromosomal gene loci, (b) CC Expanding at least one of the modified cells, (c) Transfecting many CC different DNA sequences, each flanked by recombination signals, into the cexpanded cells and (d) Integrating the DNA sequences into the gene loci con the basis of the recombination signals and the appropriate cc recombinase. The resulting cells express different proteins, each from an cc integrated DNA sequence and the proteins are bound to the cell surface. CC The method is particularly used to produce libraries of humanized cc monoclonal antibodies, for selection of those with affinity for particular antigens and useful for diagnostic or therapeutic use. CC Libraries of T cell receptors may also be prepared. The method produces celection from a large number of proteins, allows relatively simple cc sequences), is suitable for large seasy, quick and automatable cc simple verification and characterization of selected cell lines. The method does not require incorporation of a resistance marker. This cc invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 1664

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to zcyto20, zcyto21, zcyto22, zcyto24 and zcyto25 polypeptides and polymucleotides. Sequences of the invention are useful for treating hairy cell leukaemia, renal cell or basal cell carcinoma, malignant melanoma, AIDS-related Kaposi's sarcoma, multiple myeloma, non Hodgkin's lymphoma, hepatitis B, C or D, infections (e.g. bacterial, fungal or protozoal) or myocarditis. The invention is useful for growth regulation in the liver, blood vessel formation and other developmental processes. The invention is also useful in immunotherapy and gene therapy. The present sequence is a PCR primer used to amplify human zcyto20 and zcyto22 DNA

Spytek KA, Stone DJ, Vernet CAM, Zhong H, Zhong M, Alsobrook JP; New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory CNS 2003-210149/20. diseases. Rieger DK; Kekuda R;

Example SEQ ID NO 529; 772pp; English.

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to a primer used to amplify and isolate the coding sequence for one of the polypeptides of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      identification of early and adult life history stages of myctophids i.e., Lantern fishes. The specifics specific primers are employed to amplify a selected gene region to produce DNA probe directed for use as genetic markers. The probes are useful for identifying myctophid larvae and hence facilitate the assessment of genetic resources and genetic variability between myctophid population. use of the primer polymucleotides for amplifying a myctophid gene or its fragment. The present sequence represents a specifically claimed Protomyctophum crockeri PCR primer, which is used in the method from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-SEP-2001;

The zinc finger polypeptide or a nucleic acid encoding such a polypeptide can be used to commodulate transcription of a receptor nucleotide sequence. The nucleic can be used to carid polypeptide capable of binding to a nucleic acid sequence comprising a receptor nucleotide sequence, where the receptor is capable of commune response, or a nucleic acid encoding such a polypeptide, can be comprised in the preparation of a medicament for use in the treatment or compression of a disease caused by a virus or of a disease associated with can immune response. The polypeptides may further be used to treat or commune response. The polypeptides may further be used to treat or compression of the receptor as the TNFR1 receptor, such as autoimmune condition of the receptor as the TNFR1 receptor, such as autoimmune condition of the receptor as the TNFR1 receptor, such as autoimmune conditions or myocarditis. The present nucleic acid sequence represents a contribution of the sequence, as described in the invention of the sequence, as described in the invention as the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ৪

an immune binding

The present invention describes a method (M1) for developing probes (P) for myctophid fish by amplifying selected gene regions in DNA extracted from muscle of fish, eluting and reamplifying amplified DNA, purifying and ligating the DNA into vector which is transformed into host cells, purifying recombinant plasmid DNA having cloned gene (P) from host cells, amplifying gene insert from probe, comparing sequence (P) prepared (P) against known sequences of similar genes, and designing species-specific primers from sequences. The method is useful for developing nucleotide

The nucleic acid polypeptide capable of binding to a nucleic acid sequence compris a receptor nucleotide sequence, where the receptor is capable of functioning as a receptor for infection by the virus or is involved in immune response, or a nucleic acid encoding such a polypeptide, can be used in the preparation of a medicament for use in the treatment or prevention of a disease caused by a virus or of a disease associated w an immune response. The polypeptides may further be used to treat or prevent various diseases or syndromes associated with or caused by malfunction of the receptor as the TNFR1 receptor, such as autoimmune diseases including inflammation, autoimmune encephalomyelitis, rheumat arthritis or myocarditis. The present nucleic acid sequence represents
                                                                                                                                                                                                                                                                                                                                                                  Developing probes for myctophid fishes, useful for genetic identification of myctophids, by generating probes for cytochrome b, internal transcribed spacer region, mitochondrial D-loop, and rhodopsin genes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC receptor and soluble or membrane bound CTLA-4 receptor. The invention are considered to a vaccine comprising an effective amount of these considered to a vaccine is useful for inducing immunity or enhancing can immune response in a cat. The protein sequences of the invention are useful for suppressing an immune response in a feline suffering from an cat undiamune disease or the protein sequences of the invention are considered in the DNA sequences of the invention is useful for redirecting an immune response in a feline to organ transplant. A converting an immune response in a feline to an immunogen such as rabies covirus, chlamydia, toxoplasmosis gondi, flea, feline immunodeficiency covirus, feline leukaemia (FeLV), feline infectious peritonitis virus (FIP), panleukopaenia virus, calcivirus, recvirus type 3, rocavirus (FIP), panleukopaenia virus, herpes virus, sarcoma virus, borna disease covirus or a parasite. The protein sequences may be further utilised to promote growth in homologous or heterologous feline species. Enhancement of immunity through the interaction of soluble CD80 or Soluble CD86 with CTLA-4 takes advantage of the natural process of regulation rather than adding foreign substances that could have multiple, even detrimental effects on overall or long term could have multiple, even detrimental effects on overall or long term could have multiple, even detrimental effects on overall or long term could have multiple, even detrimental effects on overall or long term could have multiple even detrimental of the invention of different cytokines and the nucleotide sequences of the invention from infected cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                        sequencing DNA. The method involves identifying two nucleotides which are separated by an interval in double stranded (ds) nucleic acid using restriction endonuclease that generates 5 overhang, template-directed ligation to labeled adaptors and amplification. The method is useful for identifying a first nucleotide n and a second nucleotide n+x in a ds nucleic acid segment which is a genomic DNA, cDNA, a product of an in vitro DNA amplification e.g., a polymerase chain reaction (PCR) product or a product of a strand displacement amplification; or a vector insert. It is also useful for sequencing an interval within a ds nucleic acid segment in several of staggered ds molecules produced from the double stranded nucleic acid segment. It is useful for removing all or a part of a primer sequence from a primer extended product and for automated sequencing of double-stranded DNA segments. The present sequence is a PCR primer used to illustrate the method of the invention

New polypeptide capable of binding nucleic acids for treating or preventing a disease caused by a virus or a disease associated with immune response, particularly autoimmune diseases e.g. inflammation rheumatoid arthritis. or

Example u ۲ Page 63; 105pp; English

The present invention relates to a new polypeptide capable of binding a nucleic acid comprising a receptor nucleotide sequence which can function as a receptor for virus infection or is involved in an immune response. The molecules of the invention are useful in the treatment of prevention of a disease caused by a virus or of a disease associated we prevention of a disease caused by a virus or of a disease associated we prevention. an immune ç

This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX13460-ABX13462 and ABX97186-ABX97593 represent PCR primers and probes used in the amplification and isolation of the NOVX polynucleotides represented in ABX97088-ABX97185 which encode the

The polypeptides and related antibodies are useful for modulating the cadherin-catenin related pathway in selected organs, such as the heart and testis. The nucleic acids and the antibodies are useful in the diagnosis and/or prediction of the likelihood of developing cadherin-catenin related diseases. The nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acids or the antibody is useful in manufacturing a medicament for treating cadherin-catenin related diseases, such as cancer, cardiomyopathy, specifically dilated cardiomyopathy, and male infertility. Sequences ABK41510-ABK4159 represent PCR primers used to amplify DNA encoding human and mouse alpha-catenin polypeptides, including the CTNNA3 gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CT tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The crespiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with increased from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (CDPD), allergic rhinities, acute respiratory distress sundrome, nulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                  with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CT tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The cligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor; interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a receptor lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with CCC is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (CDP)),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a chimeric antisense oligonucleotide CC targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The CC human mpGES-1 gene is located on chromosome 9, more specifically to CC 9934.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC inhibits its expression; (2) a method of inhibiting the expression of CC mpGES-1 in cells or tissues, and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, and can antisense compounds have cytostatic, CC ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
